Decoding Information Over Time

Decoding Information Over Time

How Can We Combine Measurement Modalities?

“Converging Evidence”:

Compare results from different modalities, determine commonalities and differences.

“(Asymmetric) Fusion”:

Use one modality as a constraint for another.

(e.g. EEG->fMRI, fMRI->EEG/MEG)

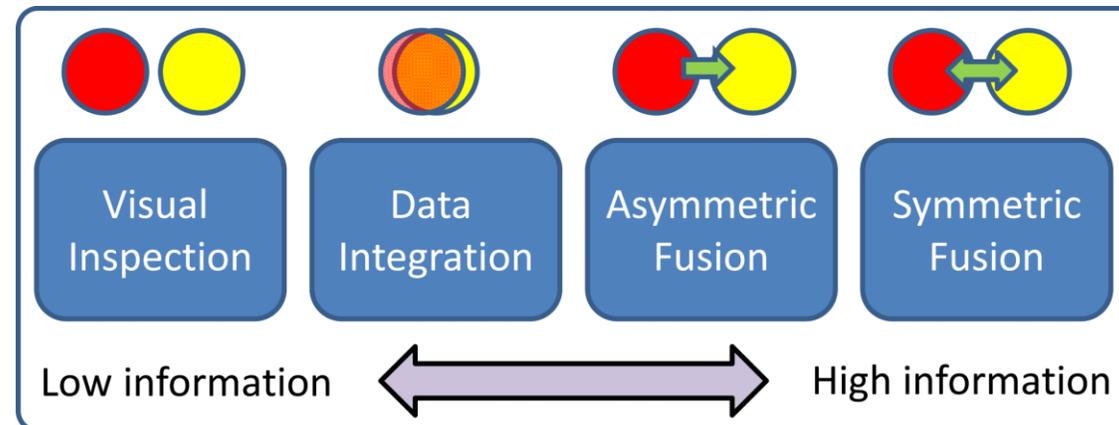

“Neural Modelling” (“Symmetric Fusion”):

Use of a common neural model that accounts for signals in all modalities.

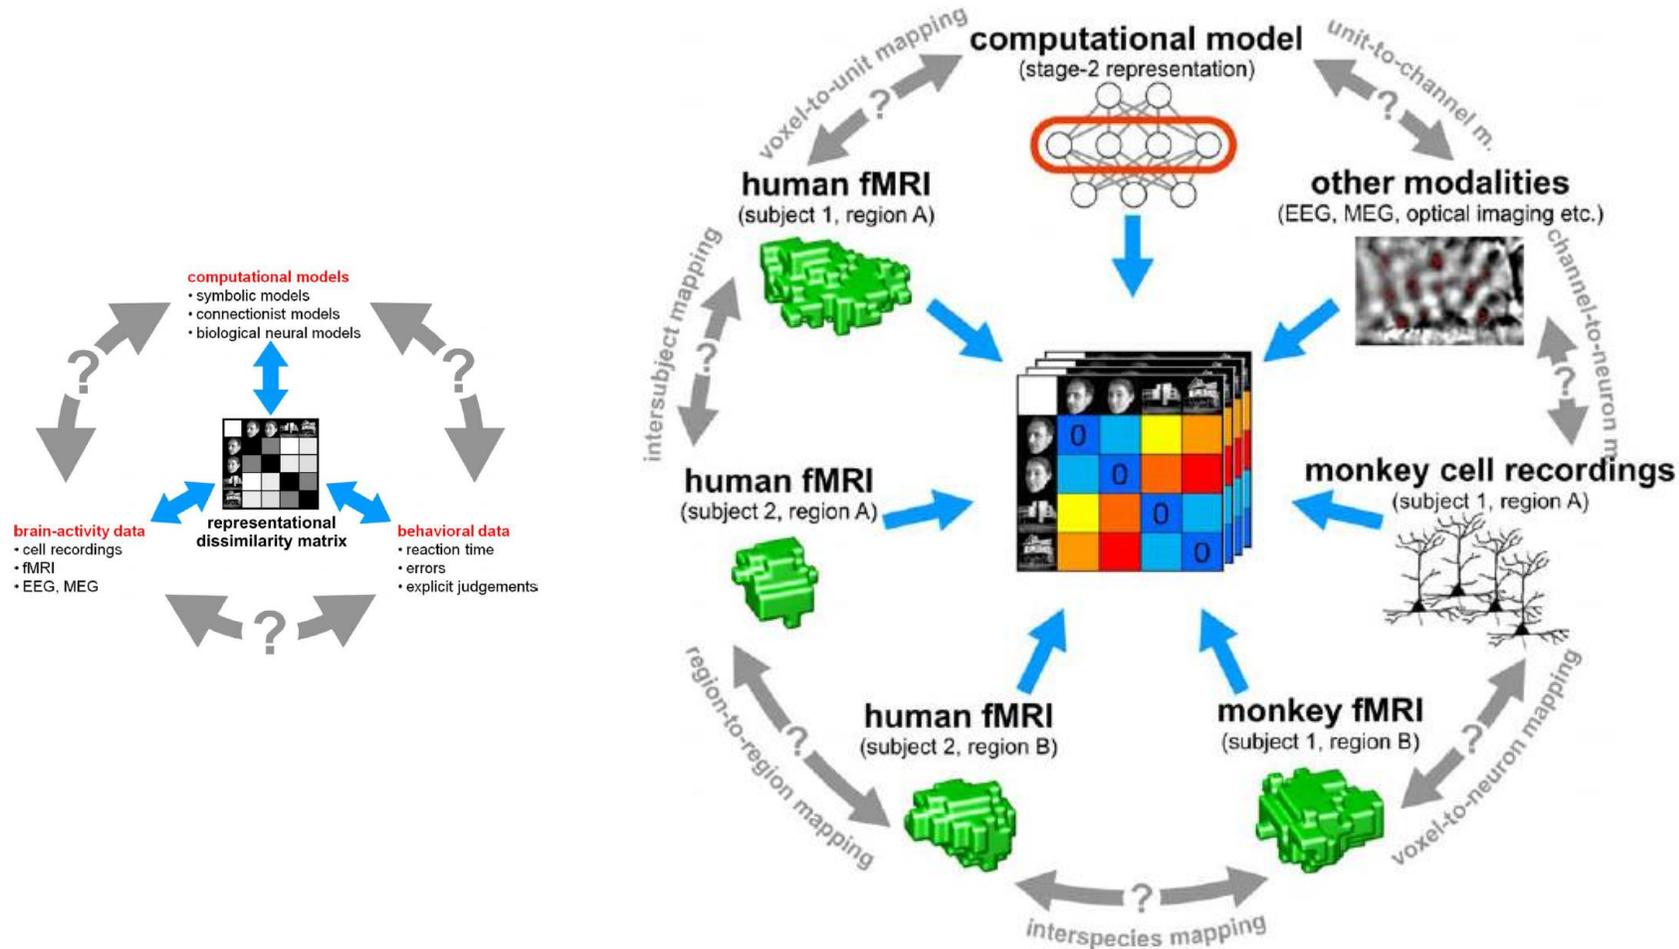

(e.g. EEG<->MEG)

e.g. Horwitz&Poeppel, HBM 2002; Henson et al., HBM 2010

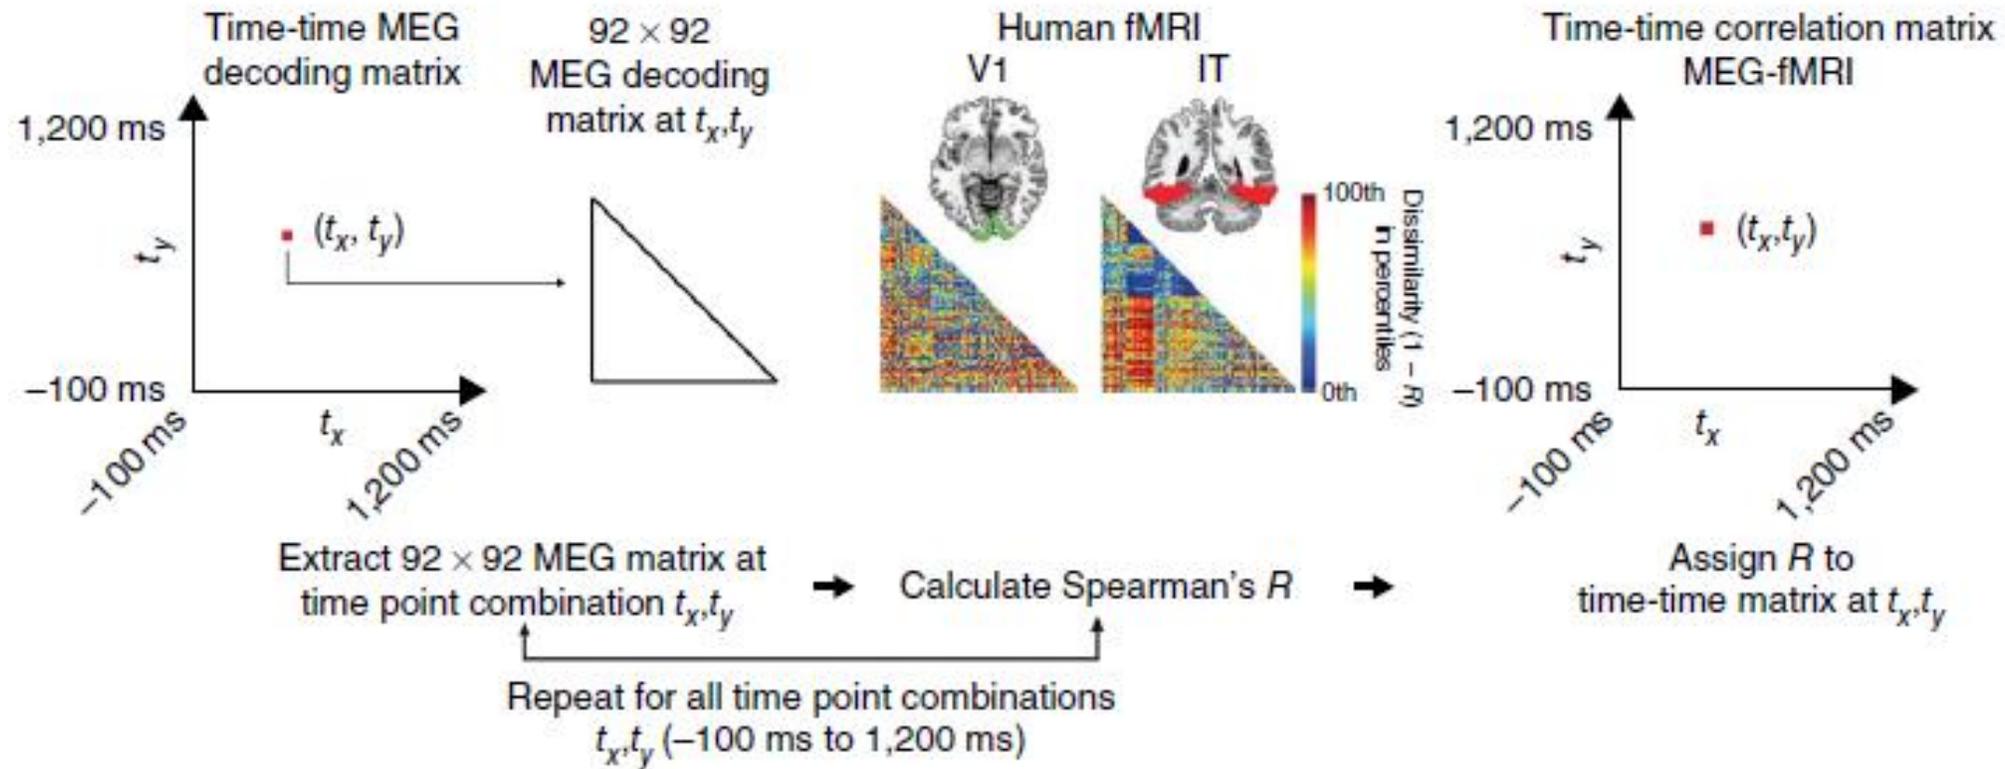

Each of these options poses different challenges with respect to modelling assumptions and complexity.

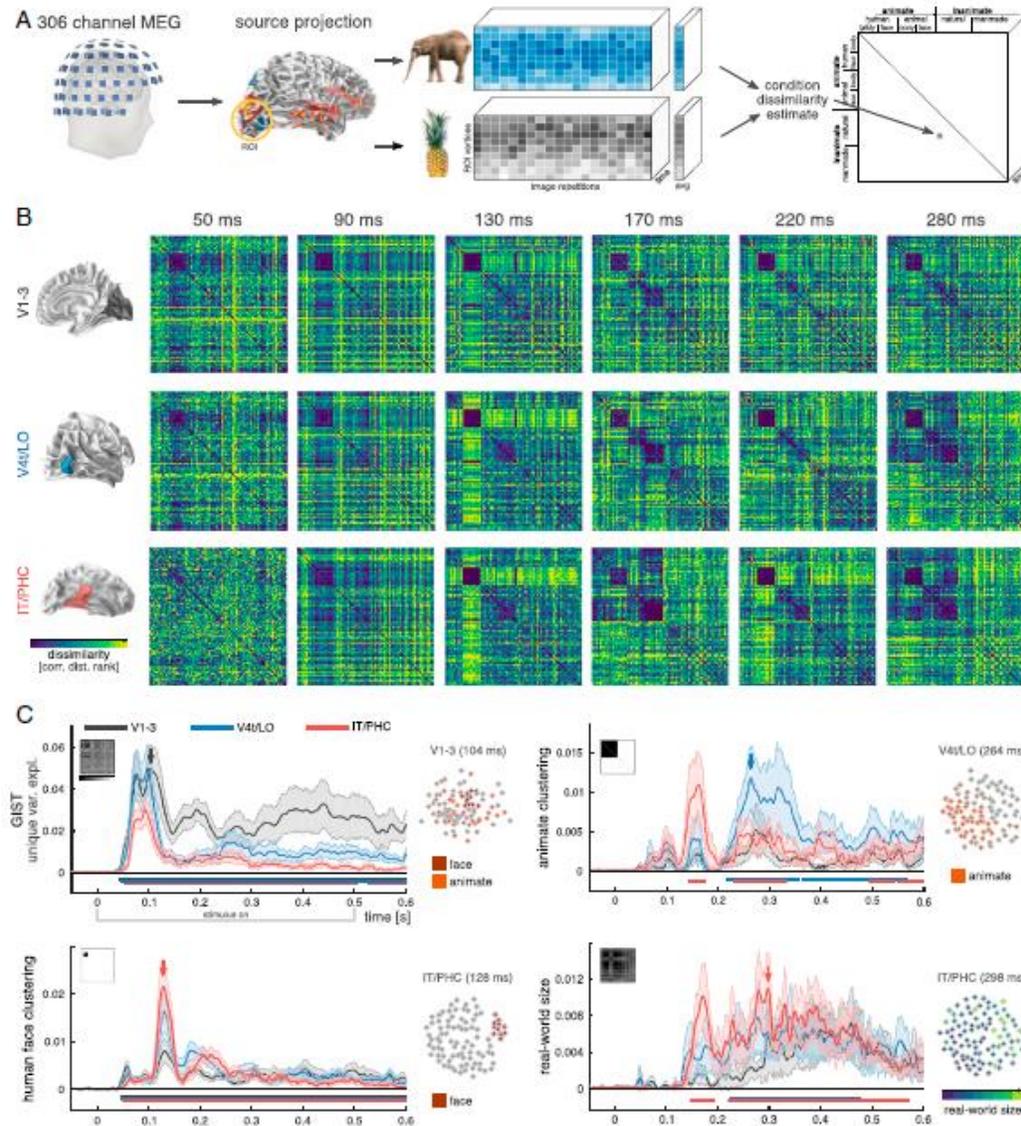

Comparing Representational Dissimilarity Across Neuroimaging Methods

EEG/MEG:
Orientation matters

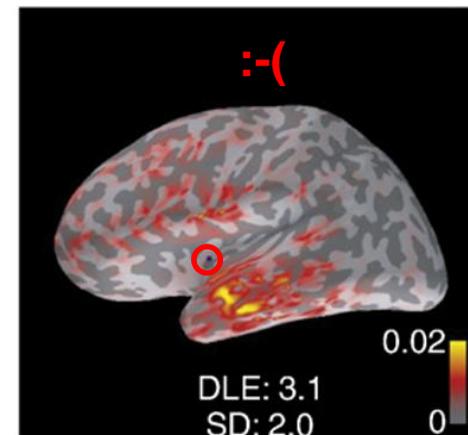

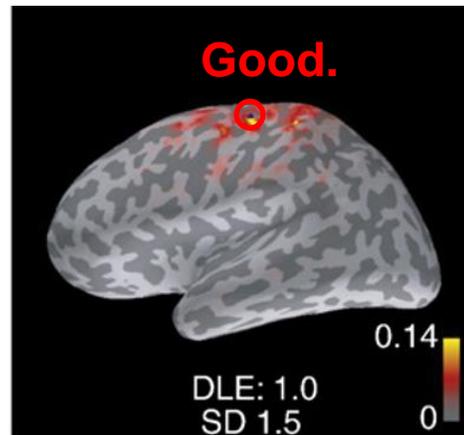

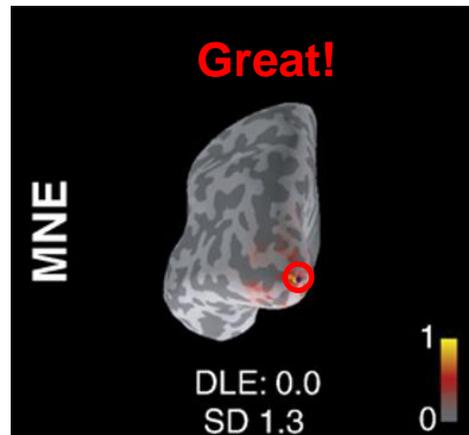

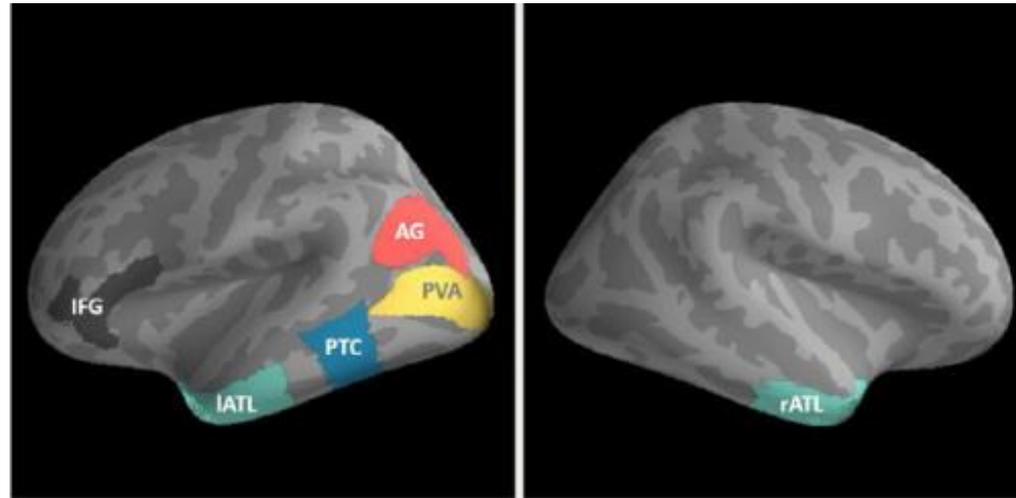

Interpreting Weight Vectors

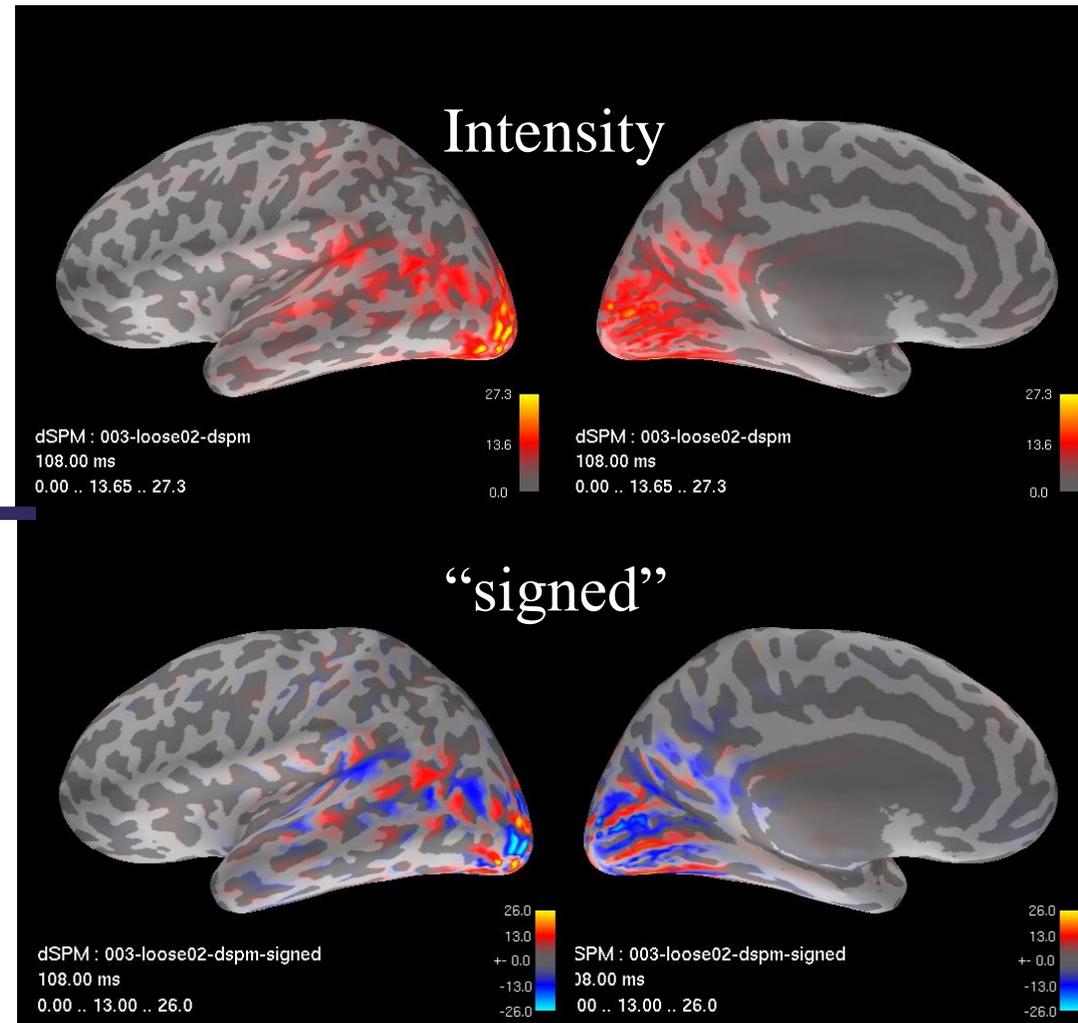

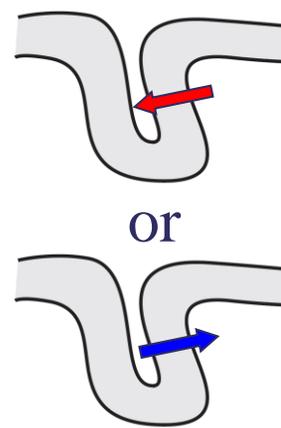

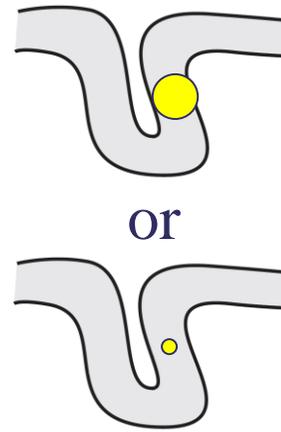

Perform Source Estimation On Patterns, Not Filter Weights

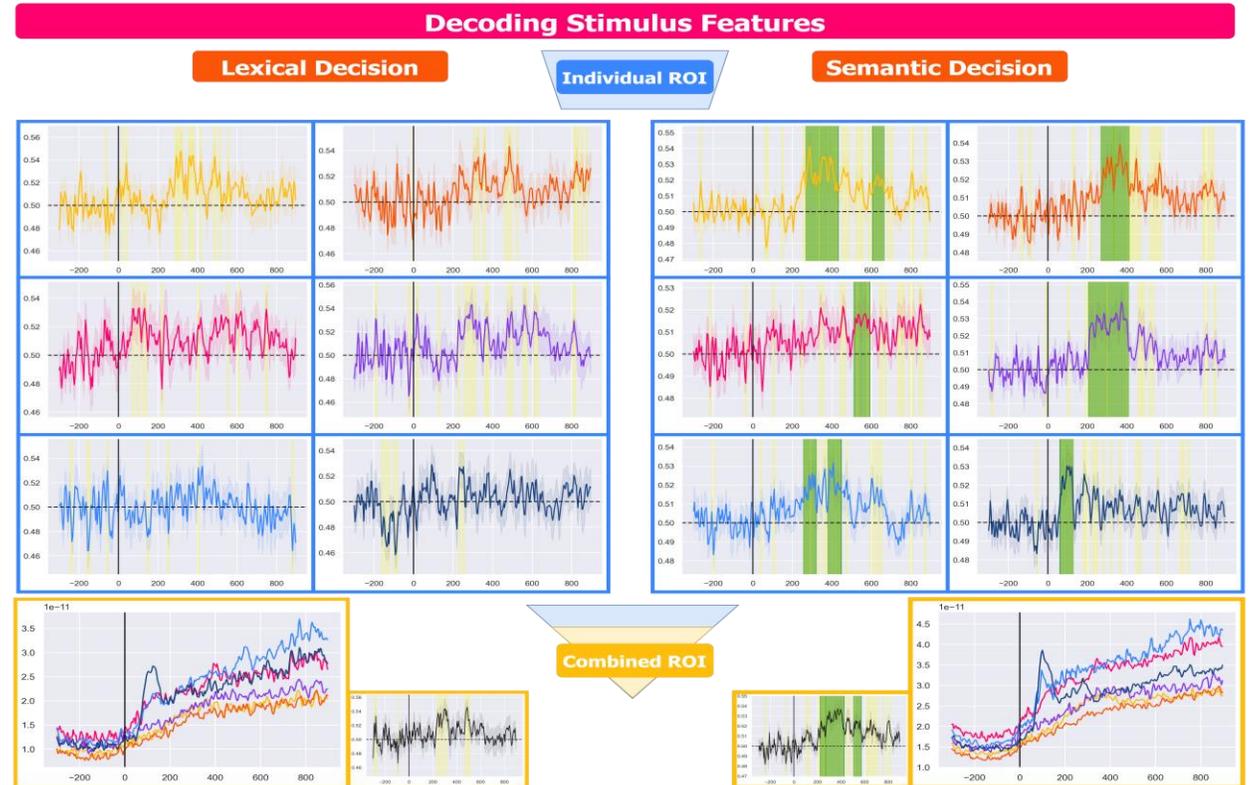

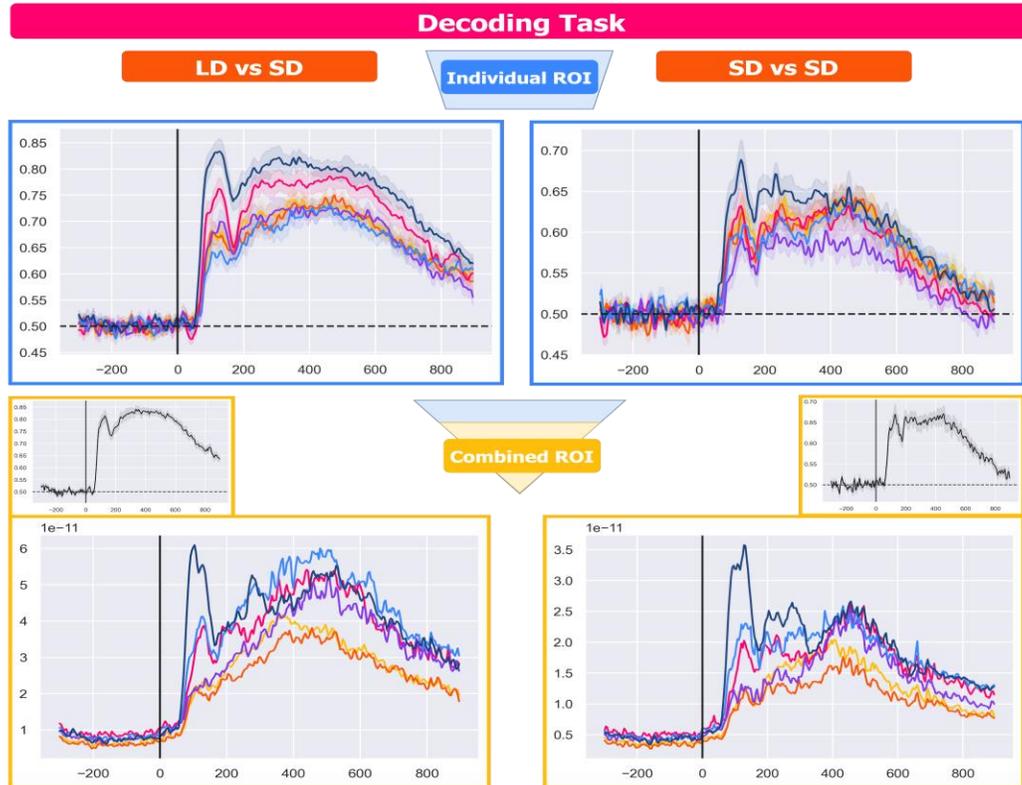

Back to Basics: Where/What to Decode From

Signed Source Estimates Contain More Information For Decoding

Back to Basics: Where/What to Decode From

■ IATL
 ■ rATL
 ■ AG
 ■ PTC
 ■ IFG
 ■ PVA
 — chance
 ■ $p < 0.05$ (corrected)

Different results whether you decode for individual ROIs or across combined ROIs.
